

HIGHWAY 185 RANCH

71.599+/- Acres – VICTORIA COUNTY

PROPERTY SUMMARY

LIST PRICE ~ \$799,000

ACREAGE: 71.599+/-

ADDRESS: 51 Traylor Road

COUNTY: Victoria

IMPROVEMENTS: 3BD/2.5 BA Home,
900+/- sq. ft. Metal Shop, Storage Shed and
Set of Cattle Working Pens

PROPERTY DESCRIPTION:

The 71+/- acre Highway 185 Ranch is located just south of Bloomington, TX near the Victoria/Calhoun County line. The ranch has good access with 1825+/- ft. of frontage along Hwy 185 and 1,700+/- ft of frontage along Traylor Road. Ranch terrain is level pastureland with approximately 15+/- acres being heavily wooded. Large, mature oak trees are concentrated around the ranch home. Improvements on the ranch include a 900+/- sq. ft. metal shop, storage shed and a set of cattle working pens. Majority of the perimeter fencing is in good condition. Ranch soils consist mostly of Edna loam and Dacosta sandy clay loam with some Laewest clay.

The ranch home is accessed off Traylor Road and totals 3,490 sq. ft. with 3-bedrooms and 2.5 baths. The kitchen features a breakfast area, wall oven/microwave and an island that includes a cook top and seating. The home has a large family room with brick fireplace and French doors leading to a large outdoor covered patio. The game room is a unique addition to this property, adding approximately 620+/- sq ft. and includes a wet bar and hunting game display nook. Updated windows and floors throughout the house. The property is only 20 minutes from Seadrift, 20 minutes from Victoria and 35 minutes to Port O'Connor, where you can enjoy some of the best saltwater fishing in Texas.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Victoria County, Texas
 Survey Area Data: Version 19, Sep 10, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Apr 23, 2020—Apr 25, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
DaA	Dacosta sandy clay loam, 0 to 1 percent slopes	23.5	32.6%
EdA	Edna loam, 0 to 1 percent slopes	39.1	54.3%
LaA	Laewest clay, 0 to 1 percent slopes	9.4	13.0%
Totals for Area of Interest		71.9	100.0%

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or
